Certified for completion of Artificial
intelligence

Projects

Detection of cyberbullying on social media using machine learning

Traditional approaches to detecting cyberbullying rely on manual moderation, which is inefficient and time-consuming. This study explores the use of machine learning techniques to automate the detection of cyberbullying in online interactions. The proposed system leverages Natural Language Processing (NLP) and supervised learning algorithms to classify text-based content as bullying or non-bullying. Various machine learning models, including Support Vector Machines (SVM), Naïve Bayes, Random Forest, and deep learning techniques such as Long Short-Term Memory (LSTM) networks are evaluated for their effectiveness in identifying abusive language, hate speech, and harassment. The dataset for training and testing is sourced from social media conversations, and feature extraction techniques like TF-IDF and word embeddings are employed for text representation. Experimental results demonstrate that machine learning models can significantly improve the accuracy of cyberbullying detection, enabling proactive measures to mitigate its impact. The study highlights the importance of automated solutions in creating a safer online environment and suggests potential improvements for real-time monitoring and intervention.

Internship

Full stack web development

Litz tech, coimbatore.

Footcap E-Commerce website

Interests

sports, cooking

Languages

Tamil

English

Soft Skills

- Adaptability
- Time Management
- Leadership
- Team player

Declaration

I hereby declare that all above furnished information are true to the best of my knowledge and belief.
